Snippets

Snippets from the world wide web: A new feature

The World Wide Web / Internet is a wonderful storehouse of information for the discerning browser. Although some of the data in these electronic information system may be unsubstantiated, facts and figures, especially from reputed journals, make interesting reading and would be most useful to the judicious reader.

From this issue of our journal, a new feature, "Snippets from the World Wide Web", would be published. It would include selected catchy titles with a brief summary of the relevant information together with the address of the internet web site for direct access of the article.

We are grateful to Mary Reed Smith, WebMD/Medpulse of Medscape for giving us permission to reproduce their internet based material in this feature publication.

The Editors and the Editorial Board hope that this innovative feature will be helpful to our readers.

**Infertility therapy linked to birth defects and low-birth-weight infants**

The use of assisted reproductive technologies is associated with a significant increase in the risk of major birth defects and in the likelihood of having a low-birth-weight infant.

**Small-for-gestational-age children may fare poorly in school**

Compared with their appropriate-for-gestational-age (AGA) counterparts, children who were small-for-gestational-age (SGA) are more likely to show poor academic achievement in later years.

**Nonsurgical management of infant clubfoot yields excellent results**

Using a series of casts to progressively modify pronation and internal rotation of the foot, orthopaedic surgeons are reporting excellent results with the nonsurgical correction of clubfoot in infants.

**Conservative measures not proven to relieve reflux in infants**

Changes in infant positioning, changes in feeding, and other conservative measures do not have proven efficacy against gastroesophageal reflux disease in infants.

**Wheezing in late childhood tied to adult asthma**

Although wheezing in early childhood often remits, such symptoms at the age of 11 years are associated with asthma in adulthood in individuals at high risk for atopy.

**Neuromuscular training reduces ACL injury by 88% in female athletes**

Girls and women who play soccer, basket-ball, or volleyball are two to eight times more likely to injure the anterior cruciate ligament (ACL) than boys and men playing the same sports in the same positions.
